

82-0510 Interference due to short-term interference sources

The effort required for effective interference suppression of short-term interference sources such as signal system, solenoid valves, electrically adjustable outside mirror, windshield washer pump, is in no reasonable relationship to the effect achieved and is therefore not included in the scope of interference suppression conducted at the factory. In the case of interference caused by these users it may be pointed out that these occur only while the traffic situation requires increased attention so that during this short time an impairment of the radio reception can be accepted.

Subsequent interference suppression is possible in individual cases. However, these jobs are very time-consuming and expensive for the customer.
